Additional Project Information

Hi, thank you for your patience.

I've finalized the detailed project plan with milestones and the component list. It took me time because I wanted to carefully research and select the right components that will work for the entire project. This way, we won't need to make changes later. Your dedication is greatly appreciated

The listed components will be used from milestone one through to the final product. The list covers one complete unit. Some key parts, like the microcontroller, are included in extra quantities to support future adjustments. I also tried to keep the costs as low as possible, but since we are ordering two units, the total may be slightly higher than expected. The main cost drivers are the MPPT solar charger, battery, and solar system. I chose reliable parts instead of cheaper but less dependable options.
At this stage of the proj., we're okay with slightly less reliable if it gets us a working prototype at a cheaper cost. We don't need longevity, we need a minimally viable product

If you'd like, I can place the order on your behalf. I already have everything ready. I also created a bill of materials for documentation.

I want to clarify something about pricing. The original quote was only for assembling the circuit on a breadboard or a simple PCB with basic connections. If you want a more complete and professional build—ready to install inside a waterproof enclosure with proper wiring, battery level display, power button, and an LDR for automation—that requires additional work. Understood and appreciated.

For this, I will charge $15/hour. Completing these enhancements will take around two days, so about $150 total. This includes:

-Full enclosure assembly with waterproofing Waterproofing should be as simple and low-cost as humanly possible. Duct tape and leftover food containers.
-Battery level indicator on the outside of the box There is no need for someone to know the battery level of the system. As long as the system is self-sustaining
-Power switch integration Need clarification as to why this is needed.
-LDR sensor for light-based control
-Deep sleep mode for power optimization Is this deep sleep mode a necessary feature for the battery? for the micro-controller? Need some clarification on this.
-Testing in real conditions (battery lifespan, charging efficiency, etc.)

If you prefer, I can also deliver the raw version as originally planned (breadboard assembly, no enclosure, no extra features). The choice is yours, and I'm fine with either approach. Somewhere between the raw version and the one that is originally specified might be the best choice for us presently. As stated above, we're looking for a minimally viable product.
So as long as we can guarantee that it works to specification, we need as few bells-and-whistles as possible.

For the next milestone (IoT integration), we can discuss details once this stage is complete. If you approve the customization, I'll proceed with the detailed build. Otherwise, I'll stick to the base plan. In both cases, the base milestone one price on Fiverr stays the same.
Any additional work in the future will also be charged at $15/hour, but nothing beyond that. Good to know. I look forward to working with you on the next phase.
Thank you again. I'm confident you'll be happy with the results.

Thanks for all your hard work.
